Read this owner’s manual carefully before operating your outboard motor.
Important manual information

To the owner
Thank you for choosing a Yamaha outboard motor. This Owner’s Manual contains information needed for proper operation, maintenance and care. A thorough understanding of these simple instructions will help you obtain maximum enjoyment from your new Yamaha. If you have any question about the operation or maintenance of your outboard motor, please consult a Yamaha dealer.

In this Owner’s Manual particularly important information is distinguished in the following ways.

⚠️ The Safety Alert Symbol means ATTENTION! BECOME ALERT! YOUR SAFETY IS INVOLVED!

⚠️ WARNING
Failure to follow WARNING instructions could result in severe injury or death to the machine operator, a bystander, or a person inspecting or repairing the outboard motor.

⚠️ CAUTION:
A CAUTION indicates special precautions that must be taken to avoid damage to the outboard motor.

NOTE:
A NOTE provides key information to make procedures easier or clearer.

Yamaha continually seeks advancements in product design and quality. Therefore, while this manual contains the most current product information available at the time of printing, there may be minor discrepancies between your machine and this manual. If there is any question concerning this manu-
al, please consult your Yamaha dealer.

To ensure long product life, Yamaha recommends that you use the product and perform the specified periodic inspections and maintenance by correctly following the instructions in the owner’s manual. Note that if you do not follow these instructions, not only may the product break down, but the warranty will also be voided.

Some countries have laws or regulations restricting users from taking the product out of the country where it was purchased, and it may be impossible to register the product in the destination country. Additionally, the warranty may not apply in certain regions. When planning to take the product to another country, consult the dealer where the product was purchased for further information.

If the product was purchased used, please consult your closest dealer for customer re-registration, and to be eligible for the specified services.

NOTE:
The F50FEHT, F50FET, FT50GET, F60CEHT, F60CET, FT60DET and the standard accessories are used as a base for the explanations and illustrations in this manual. Therefore some items may not apply to every model.

General information

Identification numbers record

Outboard motor serial number
The outboard motor serial number is stamped on the label attached to the port side of the clamp bracket.
Record your outboard motor serial number in the spaces provided to assist you in ordering spare parts from your Yamaha dealer or for reference in case your outboard motor is stolen.

Key number
If a main key switch is equipped with the motor, the key identification number is stamped on your key as shown in the illustration.
Record this number in the space provided for reference in case you need a new key.

C-Tick label
Engines affixed with this label conform to certain portion(s) of the Australian Radio Communications Act.
General information

Safety information

- Before mounting or operating the outboard motor, read this entire manual. Reading it should give you an understanding of the motor and its operation.
- Before operating the boat, read any owner’s or operator’s manuals supplied with it and all labels. Be sure you understand each item before operating.
- Do not overpower the boat with this outboard motor. Overpowering the boat could result in loss of control. The rated power of the outboard should be equal to or less than the rated horsepower capacity of the boat. If the rated horsepower capacity of the boat is unknown, consult the dealer or boat manufacturer.
- Do not modify the outboard. Modifications could make the motor unfit or unsafe to use.
- Incorrect propeller selection and incorrect use may not only cause engine damage, but also adversely affect fuel consumption. Consult your dealer for correct use.
- Never operate after drinking alcohol or taking drugs. About 50% of all boating fatalities involve intoxication.
- Have an approved personal flotation device (PFD) on board for every occupant. It is a good idea to wear a PFD whenever boating. At a minimum, children and non-swimmers should always wear PFDs, and everyone should wear PFDs when there are potentially hazardous boating conditions.
- Gasoline is highly flammable, and its vapors are flammable and explosive. Handle and store gasoline carefully. Make sure there are no gas fumes or leaking fuel before starting the engine.
- This product emits exhaust gases which contain carbon monoxide, a colorless, odorless gas which may cause brain damage or death when inhaled. Symptoms include nausea, dizziness, and drowsiness. Keep cockpit and cabin areas well ventilated. Avoid blocking exhaust outlets.
- Check throttle, shift, and steering for proper operation before starting the engine.
- Attach the engine stop switch lanyard to a secure place on your clothing, or your arm or leg while operating. If you accidentally leave the helm, the lanyard will pull from the switch, stopping the engine.
- Know the marine laws and regulations where you will be boating - and obey them.
- Stay informed about the weather. Check weather forecasts before boating. Avoid boating in hazardous weather.
- Tell someone where you are going: leave a Float Plan with a responsible person. Be sure to cancel the Float Plan when you return.
- Use common sense and good judgment when boating. Know your abilities, and be sure you understand how your boat handles under the different boating conditions you may encounter. Operate within your limits, and the limits of your boat. Always operate at safe speeds, and keep a careful
General information

watch for obstacles and other traffic.
- Always watch carefully for swimmers during the engine operation.
- Stay away from swimming areas.
- When a swimmer is in the water near you shift into neutral and shut off the engine.
- Do not illegally discard empty containers used to replace or replenish oil. For the correct processing of empty containers, consult the dealer where you purchased the oil.
- When replacing oils used to lubricate the product (engine or gear oil), be sure to wipe away any spilt oil. Never pour oil without using a funnel or similar device. If necessary, verify the necessary replacement procedure with the dealer.
- Never illegally discard (dump) the product. Yamaha recommends consulting the dealer on discarding the product.

Important labels

Warning labels

WARNING
- Be sure shift control is in neutral before starting engine. (except 2HP)
- Do not touch or remove electrical parts when starting or during operation.
- Keep hands, hair, and clothes away from flywheel and other rotating parts while engine is running.

Caution labels

- This engine is equipped with a neutral starting device.
- The engine will not start unless the shift control is in neutral position.
General information

Label
EMU25473

CAUTION:
Transport and store the engine only as shown. Otherwise, engine damage could result from leaking oil.

Fueling instructions
EMU25540

WARNING
GASOLINE AND ITS VAPORS ARE HIGHLY FLAMMABLE AND EXPLOSIVE!
- Do not smoke when refueling, and keep away from sparks, flames, or other sources of ignition.
- Stop engine before refueling.
- Refuel in a well-ventilated area. Refuel portable fuel tanks off the boat.
- Take care not to spill gasoline. If gasoline spills, wipe it up immediately with dry rags.
- Do not overfill the fuel tank.
- Tighten the filler cap securely after refueling.
- If you should swallow some gasoline, inhale a lot of gasoline vapor, or get gasoline in your eyes, get immediate medical attention.
- If any gasoline spills onto your skin, immediately wash with soap and water. Change clothing if gasoline spills on it.
- Touch the fuel nozzle to the filler opening or funnel to help prevent electrostatic sparks.

CAUTION:_________________________
Use only new clean gasoline which has been stored in clean containers and is not contaminated with water or foreign mat-

ter.

EMU29870

Gasoline

Recommended gasoline:
Regular unleaded gasoline with a minimum octane rating of 90 (Research Octane Number).

If knocking or pinging occurs, use a different brand of gasoline or premium unleaded fuel.

EMU25683

Engine oil

Recommended engine oil:
4-stroke motor oil with a combination of the following SAE and API oil classifications
Engine oil type SAE:
10W-30 or 10W-40
Engine oil grade API:
SE, SF, SG, SH, SJ, SL
Engine oil quantity (excluding oil filter):
2.5 L (2.64 US qt) (2.20 Imp.qt)

NOTE:_________________________
If the recommended engine oil grades are not available, select an alternative from the following chart according to the average temperatures in your area.
General information

CAUTION:
All 4-stroke engines are shipped from the factory without engine oil.

Battery requirement

CAUTION:
Do not use a battery that does not meet the specified capacity. If a battery which does not meet specifications is used, the electric system could perform poorly or be overloaded, causing electric system damage.

For electric start models, choose a battery which meets the following specifications.

Minimum cold cranking amps (CCA/EN): 430.0 A
Minimum rated capacity (20HR/IEC): 70.0 Ah

NOTE:
The engine cannot be started if battery voltage is too low.

Propeller selection

The performance of your outboard motor will be critically affected by your choice of propeller, as an incorrect choice could adversely affect performance and could also seriously damage the motor. Engine speed depends on the propeller size and boat load. If engine speed is too high or too low for good engine performance, this will have an adverse effect on the engine.

Yamaha outboard motors are fitted with propellers chosen to perform well over a range of applications, but there may be uses where a propeller with a different pitch would be more appropriate. For a greater operating load, a smaller-pitch propeller is more suitable as it enables the correct engine speed to be maintained. Conversely, a larger-pitch propeller is more suitable for a smaller operating load.

Yamaha dealers stock a range of propellers, and can advise you and install a propeller on your outboard that is best suited to your application.
**General information**

![Diagram of propeller](EMU25770)

**Start-in-gear protection**

Yamaha outboard motors or Yamaha-approved remote control units are equipped with start-in-gear protection device(s). This feature permits the engine to be started only when it is in neutral. Always select neutral before starting the engine.

![Diagram of propeller](ZMU04606)

1. Propeller diameter in inches
2. Propeller pitch in inches
3. Type of propeller (propeller mark)

![Diagram of propeller](ZMU04607)

1. Propeller diameter in inches
2. Propeller pitch in inches
3. Type of propeller (propeller mark)

**NOTE:**

Select a propeller which will allow the engine to reach the middle or upper half of the operating range at full throttle with the maximum boat load. If operating conditions such as light boat loads then allow the engine r/min to rise above the maximum recommended range, reduce the throttle setting to maintain the engine in the proper operating range.

For instructions on propeller removal and installation, see page 64.
Basic components

Main components

NOTE:

* May not be exactly as shown; also may not be included as standard equipment on all models.

F50F, FT50G, F60C, FT60D

1. Top cowling
2. Water separator
3. Top cowling lock lever
4. Drain screw
5. Anode
6. Anti-cavitation plate
7. Trim tab (anode)
8. Propeller
9. Cooling water inlet
10. Anode(s)
11. Clamp bracket
12. Tilt support lever
13. Flushing device
14. Tiller handle*
15. Remote control box (side mount type)*
16. Remote control box (binnacle mount type)*
17. Switch panel (for use with binnacle type)*
18. Digital tachometer*
19. Digital speedometer*
20. Tachometer*
21. Trim meter*
22. Fuel tank
Basic components

1. Tachometer unit (Square type)*
2. Speedometer unit (Square type)*
3. Fuel management meter (Square type)*

**Fuel tank**
If your model was equipped with a portable fuel tank, its function is as follows.

**WARNING**
The fuel tank supplied with this engine is its dedicated fuel reservoir and must not be used as a fuel storage container. Commercial users should conform to relevant licensing or approval authority regulations.

**Fuel joint**
This joint is used to connect the fuel line.

**Fuel tank cap**
This cap seals the fuel tank. When removed,
the tank can be filled with fuel. To remove the cap, turn it counterclockwise.

Air vent screw
This screw is on the fuel tank cap. To loosen the screw, turn it counterclockwise.

Remote control
The remote control lever actuates both the shifter and the throttle. The electrical switches are mounted on the remote control box.

1. Power trim and tilt switch
2. Remote control lever
3. Neutral interlock trigger
4. Neutral throttle lever
5. Main switch / choke switch
6. Engine stop lanyard switch
7. Throttle friction adjuster

Remote control lever
Moving the lever forward from the neutral position engages forward gear. Pulling the lever back from neutral engages reverse. The engine will continue to run at idle until the lever is moved about 35° (a detent can be felt). Moving the lever farther opens the throttle, and the engine will begin to accelerate.
Basic components

3. Reverse “R”
4. Shift
5. Fully closed
6. Throttle
7. Fully open

Neutral interlock trigger
To shift out of neutral, first pull the neutral interlock trigger up.

Neutral throttle lever
To open the throttle without shifting into either forward or reverse, put the remote control lever in the neutral position and lift the neutral throttle lever.

NOTE:
The neutral throttle lever will operate only when the remote control lever is in neutral. The remote control lever will operate only when the neutral throttle lever is in the closed position.

Free accelerator
To open the throttle without shifting into either forward or reverse, push the free accelerator button and move the remote control lever.

NOTE:
- The free accelerator button can only be used when the remote control lever is in the neutral position.
- After the button is pushed, the throttle begins to open after the remote control lever is moved at least 35°.
- After using the free accelerator, return the
remote control lever to the neutral position. The free accelerator button will return automatically to its set position. The remote control will then engage forward and reverse normally.

**Tiller handle**
To change direction, move the tiller handle to the left or right as necessary.

**Gear shift lever**
Pulling the gear shift lever towards you puts the engine in forward gear so that the boat moves ahead. Pushing the lever away from you puts the engine in reverse gear so that the boat moves astern.

**Throttle grip**
The throttle grip is on the tiller handle. Turn the grip counterclockwise to increase speed and clockwise to decrease speed.

**Throttle indicator**
The fuel consumption curve on the throttle indicator shows the relative amount of fuel consumed for each throttle position. Choose the setting that offers the best performance and fuel economy for the desired operation.

**Throttle friction adjuster**
A friction device provides adjustable resistance to movement of the throttle grip or the remote control lever, and can be set according to operator preference. To increase resistance, turn the adjuster clockwise. To decrease resistance, turn the...
Basic components

adjuster counterclockwise.

**WARNING**
Do not overtighten the friction adjuster. If there is too much resistance, it could be difficult to move the remote control lever or throttle grip, which could result in an accident.

When constant speed is desired, tighten the adjuster to maintain the desired throttle setting.

---

**Engine stop lanyard switch**

The lock plate must be attached to the engine stop switch for the engine to run. The lanyard should be attached to a secure place on the operator’s clothing, or arm or leg. Should the operator fall overboard or leave the helm, the lanyard will pull out the lock plate, stopping ignition to the engine. This will prevent the boat from running away under power.

**WARNING**
- Attach the engine stop switch lanyard to a secure place on your clothing, or your arm or leg while operating.
- Do not attach the lanyard to clothing that could tear loose. Do not route the lanyard where it could become entangled, preventing it from functioning.
- Avoid accidentally pulling the lanyard during normal operation. Loss of engine power means the loss of most steering control. Also, without engine power, the boat could slow rapidly. This could cause people and objects in the boat to be thrown forward.

**NOTE:**
The engine cannot be started with the lock plate removed.
Basic components

**Engine stop button**
To open the ignition circuit and stop the engine, push this button.

**Main switch**
The main switch controls the ignition system; its operation is described below.

- **“OFF” (off)**
  With the main switch in the “OFF” (off) position, the electrical circuits are off, and the key can be removed.

- **“ON” (on)**
  With the main switch in the “ON” (on) position, the electrical circuits are on, and the key cannot be removed.

- **“START” (start)**
  With the main switch in the “START” (start) position, the starter motor turns to start the engine. When the key is released, it returns automatically to the “ON” (on) position.
Basic components

Steering friction adjuster
A friction device provides adjustable resistance to the steering mechanism, and can be set according to operator preference. An adjuster lever is located on the bottom of the tiller handle bracket.
To increase resistance, turn the lever to the port side “A”.
To decrease resistance, turn the lever to the starboard side “B”.

WARNING
Do not overtighten the friction adjuster. If there is too much resistance, it could be difficult to steer, which could result in an accident.

If the resistance does not increase even when the lever is turned to the port side “A”, make sure that the nut is tightened to the specified torque.

Nut tightening torque:
3.7 Nm (2.7 ft-lb) (0.4 kgf-m)

NOTE:
- Check the tiller handle for smooth movement when the lever is turned to the starboard side “B”.
- Do not apply lubricants such as grease to the friction areas of the steering friction adjuster.

Power trim and tilt switch on remote control or tiller handle
The power trim and tilt system adjusts the
Basic components

outboard motor angle in relation to the transom. Pressing the switch “UP” (up) trims the outboard motor up, then tilts it up. Pressing the switch “DN” (down) tilts the outboard motor down and trims it down. When the switch is released, the outboard motor will stop in its current position.

**NOTE:**
For instructions on using the power trim and tilt switch, see pages 41 and 43.

---

**Power trim and tilt switch on bottom engine cowling**

The power trim and tilt switch is located on the side of the bottom engine cowling. Pressing the switch “UP” (up) trims the outboard motor up, then tilts it up. Pressing the switch “DN” (down) tilts the outboard motor down and trims it down. When the switch is released, the outboard motor will stop in its current position.

**WARNING**
Use the power trim and tilt switch located on the bottom engine cowling only when the boat is at a complete stop with the engine off. Attempting to use this switch while the boat is moving could increase the risk of falling overboard and could distract the operator, increasing the risk of collision with another boat or an obstacle.

**NOTE:**
For instructions on using the power trim and tilt switch, see page 43.

---

**Variable trolling RPM switches**
The trolling speed can be adjusted when the
Basic components

outboard motor is trolling. Press the “UP” switch to increase the trolling speed and press the “DN” switch to decrease the trolling speed.

NOTE:
- The trolling speed changes approximately 50 r/min each time a switch is pressed.
- If the trolling speed has been adjusted, the engine returns to the normal trolling speed when the engine is stopped and restarted or when the engine speed exceeds approximately 3000 r/min.
- For instructions on using the variable trolling RPM switches, see page 40.

If the boat tends to veer the left (port side), turn the trim tab rear end to the port side “A” in the figure. If the boat tends to veer the right (starboard side), turn the trim tab end to the starboard side “B” in the figure.

CAUTION:
The trim tab also serves as an anode to protect the engine from electrochemical corrosion. Never paint the trim tab as it will become ineffective as an anode.

Trim tab with anode

The trim tab should be adjusted so that the steering control can be turned to either the right or left by applying the same amount of force.

WARNING
An improperly adjusted trim tab could cause difficult steering. Always test run after the trim tab has been installed or replaced to be sure steering is correct. Be sure you have tightened the bolt after adjusting the trim tab.
Basic components

**EMU26340**

Tilt support lever for power trim and tilt or hydro tilt model
To keep the outboard motor in the tilted up position, lock the tilt support lever to the clamp bracket.

**NOTE:**
For details on usage, see page 54.

**EMU26372**

Top cowling lock lever(s) (turn type)
To remove the engine top cowling, turn the lock lever(s) and lift off the cowling. When installing the cowling, check to be sure it fits properly in the rubber seal. Then lock the cowling again by returning the lever(s) to the lock position.

**EMU26460**

Flushing device
This device is used to clean the cooling water passages of the motor using a garden hose and tap water.

**EMU31702**

Water separator
This engine has a combination fuel filter/water separator and associated warning system. If water separated from the fuel exceeds a specific volume, the warning device will activate.

Activation of warning device
- The water separator warning indicator will blink.
- The buzzer will sound intermittently only when the gear shift is in neutral.
- If the warning system has activated, stop the engine and consult a Yamaha dealer immediately.
Basic components

**Warning indicator**

If the engine develops a condition which is cause for warning, the indicator lights up. For details on how to read the warning indicator, see page 27.

**Digital tachometer**

The tachometer shows the engine speed and has the following functions.

**NOTE:**

All segments of the display will light momentarily after the main switch is turned on and will return to normal thereafter.

**Tachometer**

This gauge shows the engine speed and has the following functions.
Basic components

NOTE:
The water separator and engine trouble warning indicators only operate when the engine is equipped with the appropriate functions.

EMU26503

Low oil pressure warning indicator
If oil pressure drops too low, this indicator will flash. For further information, see page 27.

CAUTION:
- Do not continue to run the engine if the low oil pressure warning indicator is on and the engine oil level is lower. Serious engine damage will occur.
- The low oil pressure warning indicator does not indicate the engine oil level. Use the oil dipstick to check the remaining oil quantity. For further information, see page 33.

EMU26522

Low oil pressure warning indicator
If oil pressure drops too low, the warning indicator will start to blink. For further information, see page 27.

CAUTION:
- Do not continue to run the engine if the low oil pressure warning indicator is on and the engine oil level is lower. Serious engine damage will occur.
- The low oil pressure warning indicator does not indicate the engine oil level. Use the oil dipstick to check the remaining oil quantity. For further information, see page 33.

1. Low oil pressure warning indicator

EMU26572

Overheat warning indicator
If the engine temperature rises too high, this
Basic components

indicator will flash. For further information on reading the indicator, see page 27.

CAUTION:
Do not continue to run the engine if the overheat warning indicator is on. Serious engine damage will occur.

Overheat warning indicator (digital type)
If the engine temperature rises too high, the warning indicator will start to blink. For further information on reading the indicator, see page 27.

CAUTION:
Do not continue to run the engine if the overheat warning indicator is on. Serious engine damage will occur.

Speedometer (digital type)
This gauge shows the boat speed.
Basic components

NOTE:
After the main switch is first turned on, all segments of the display come on as a test. After a few seconds, the gauge will change to normal operation. Watch the gauge when turning on the main switch to make sure all segments come on.

NOTE:
The speedometer displays km/h, mph, or knots, according to operator preference. Select the desired unit of measurement by setting the selector switch on the back of the gauge. See the illustration for settings.

Trim meter
This gauge shows the trim angle of your outboard motor.

NOTE:
Memorize the trim angles that work best for your boat under different conditions. Adjust the trim angle to the desired setting with the power trim and tilt switch.

If the trim angle of your motor exceeds the trim operating range, the top segment on the trim meter display will blink.

Hour meter (digital type)
This meter shows the number of hours the
Basic components

The engine has been run. It can be set to show the total number of hours or the number of hours for the current trip. The display can also be turned on and off.

- Changing the display format
- Pressing the “mode” (mode) button changes the display format in the following pattern:
  - Total hours → Trip hours → Display off
- Resetting the trip hours
- Simultaneously pressing the “set” (set) and “mode” (mode) buttons for more than 1 second while the trip hours are displayed resets the trip counter to 0 (zero).

NOTE:
The total number of hours the engine has been run cannot be reset.

Trip meter
This gauge displays the distance the boat has traveled since the gauge was last reset. Press the “mode” (mode) button repeatedly until the indicator on the face of the gauge points to “TRIP” (trip). To reset the trip meter to zero, press the “set” (set) and “mode” (mode) buttons at the same time.

NOTE:
The trip distance is shown in kilometers or miles depending upon the unit of measurement selected for the speedometer.

The trip distance is kept in memory by battery power. The stored data will be lost if the battery is disconnected.

Clock
Press the “mode” (mode) button repeatedly until the indicator on the face of the gauge points to “TIME” (time). To set the clock, be sure the gauge is in the “TIME” (time) mode. Press the “set” (set) button; the hour display will begin blinking. Press the “mode” (mode) button until the desired hour is displayed. Press the “set” (set) button again, the minute display will begin blinking. Press the “mode” (mode) button until the desired minute is displayed. Press the “set” (set) button again to start the clock.
NOTE:
The clock operates on battery power. Disconnecting the battery will stop the clock. Reset the clock after connecting the battery.

Fuel gauge
The fuel level is indicated by eight segments. When all segments are showing, the fuel tank is full.

CAUTION:
The Yamaha fuel tank sensor differs from conventional sensors. Incorrectly setting the selector switch on the gauge will give false readings. Consult your Yamaha dealer on how to correctly set the selector switch.

NOTE:
The fuel level reading can be affected by the position of the sensor in the fuel tank and the attitude of the boat in the water. Operation with bow-up trim or continuous turning can give false readings.

Low battery voltage warning indicator
If battery voltage drops, the display will automatically turn on and begin to blink.

CAUTION:
Get back to the port soon if a warning device has activated. For charging the battery, consult your Yamaha dealer.
Basic components

**6Y8 Multifunction meters**

Multifunction meters have 6 kinds of meter units: tachometer unit (square or round types), speedometer unit (square type), speed & fuel meter unit (square or round types), and fuel management meter (square type). The indicator system is slightly different between the round and square types. Check the model and type of your unit carefully. This manual describes mainly the warning indicators. For more details on setting meters or changing indicator systems, see the attached operation manual.

**Tachometer unit**

The tachometer shows the engine revolutions per minute. It has functions of trim meter, adjusting trolling speed, cooling water/engine temperature display, battery voltage display, total hour/trip hour display, oil pressure display, water detection warning, engine trouble warning, and periodic maintenance notification. If optional sensors are connected to the unit, cooling water pressure display will be available. For the optional sensor, consult your Yamaha dealer. The tachometer unit is available in round or square types. Check your tachometer unit type.

**NOTE:**

The tachometer unit shows various kinds of information according to the setting made using the “set” (set) and “mode” (mode) buttons. For details, see the attached operation manual.

**Preoperation checks**

Place the gear shift lever in neutral and turn the main switch to “ON” (on). After all the displays come on and the total hour display comes on, the gauge will change to normal operation. If the buzzer sounds and the water separator warning indicator blinks, consult your Yamaha dealer immediately.

**NOTE:**

To stop the buzzer, press the “set” (set) or “mode” (mode) button.

**Low oil pressure warning**

When the engine oil pressure drops too low, the low oil pressure warning indicator will start to blink, and the engine speed will automatically decrease to about 2000 r/min.
Basic components

Stop the engine immediately if the buzzer sounds and the low oil pressure warning indicator blinks. Check the engine oil quantity and replenish oil if necessary. If the warning device has activated while the appropriate engine oil quantity is maintained, consult your Yamaha dealer.

**CAUTION:**
Do not continue to run the engine if the low oil pressure warning device has activated. Serious engine damage will occur.

**Overheat warning**
If the engine temperature rises too high while cruising, the overheat warning indicator will start to blink. The engine speed will automatically decrease to about 2000 r/min.

Stop the engine immediately if the buzzer sounds and the overheat warning device has activated. Check the cooling water inlet for clogging.

**CAUTION:**
- Do not continue to run the engine if the overheat warning indicator blinks. Serious engine damage will occur.
- Do not continue to operate the engine if a warning device has activated. Consult your Yamaha dealer if the problem cannot be located and corrected.

**Water separator warning**
This indicator will blink when water has accumulated in the water separator (fuel filter) while cruising. In such an event, stop the engine immediately and see page 74 of this manual to drain the water from the fuel filter. Get back to the port soon and consult a Yamaha dealer immediately.

**CAUTION:**
Gasoline mixed with water could cause damage to the engine.

**Engine trouble warning**
This indicator will blink when the engine malfunctions while cruising. Get back to the port soon and consult a Yamaha dealer immediately.
Basic components

**CAUTION:**
In such an event, the engine will not operate properly. Consult a Yamaha dealer immediately.

**Low battery voltage warning**
When the battery voltage drops, the low battery voltage warning indicator and the battery voltage value will start to blink. Get back to the port soon if the low battery voltage warning device has activated. For charging the battery, consult your Yamaha dealer.

**NOTE:**
After the main switch is first turned on, all the displays come on as a test. After a few seconds, the gauge will change to normal operation.

**NOTE:**
The speedometer unit shows various kinds of information according to the setting made using the “set” (set) and “mode” (mode) buttons. In addition, the speedometer can show the desired unit of measurement such as km/h, mph, or knots. For details, see the at-

---

**Speedometer unit**
This unit shows the boat speed and has functions of fuel meter and system voltage display. If optional sensors are connected to the unit, trip display, water surface temperature display, depth display, and clock will be available. For the optional sensor, consult your Yamaha dealer.
Basic components

Fuel management meter
This meter has functions of fuel flow meter, total consumption display, fuel economy display, and remaining fuel display.

NOTE:
After the main switch is first turned on, all the displays come on as a test. After a few seconds, the gauge will change to normal operation.

NOTE:
The fuel management meter shows various kinds of information when the operator uses the “set” (set) and “mode” (mode) buttons. For details, see the attached operation manual.

Warning system

CAUTION:
Do not continue to operate the engine if a warning device has activated. Consult your Yamaha dealer if the problem cannot be located and corrected.

Overheat warning
This engine has an overheat warning device. If the engine temperature rises too high, the warning device will activate.

Activation of warning device
• The engine speed will automatically decrease to about 2000 r/min.

• If equipped with an overheat warning indicator, it will light or blink.
Basic components

The buzzer will sound (if equipped on the tiller handle, remote control box, or main switch panel).

If the warning system has activated, stop the engine and check the cooling water inlet for clogging.

Low oil pressure warning
If the oil pressure drops too low, the warning device will activate.

Activation of warning device
- The engine speed will automatically decrease to about 2000 r/min.
Basic components

- If equipped with a low oil pressure warning indicator, it will light or blink.

- The buzzer will sound (if equipped on the tiller handle, remote control box, or main switch panel).

If the warning system has activated, stop the engine as soon as it is safe to do so. Check the oil level and add oil as needed. If the oil level is correct and the warning device does not switch off, consult your Yamaha dealer.

**CAUTION:**
Do not continue to run the engine if the
Basic components

Low oil pressure warning indicator is on.
Serious engine damage could occur.
Operation

Installation

CAUTION:
Incorrect engine height or obstructions to smooth water flow (such as the design or condition of the boat, or accessories such as transom ladders or depth finder transducers) can create airborne water spray while the boat is cruising. Severe engine damage may result if the motor is operated continuously in the presence of airborne water spray.

NOTE:
During water testing check the buoyancy of the boat, at rest, with its maximum load. Check that the static water level on the exhaust housing is low enough to prevent water entry into the powerhead, when water rises due to waves when the outboard is not running.

Mounting the outboard motor

WARNING
Overpowering a boat could cause severe instability. Do not install an outboard motor with more horsepower than the maximum rating on the capacity plate of the boat. If the boat does not have a capacity plate, consult the boat manufacturer.

The information presented in this section is intended as reference only. It is not possible to provide complete instructions for every possible boat and motor combination. Proper mounting depends in part on experience and the specific boat and motor combination.

WARNING
Improper mounting of the outboard motor could result in hazardous conditions such as poor handling, loss of control, or fire hazards. Observe the following:

- For permanently mounted models, your dealer or other person experienced in proper rigging should mount the motor. If you are mounting the motor yourself, you should be trained by an experienced person.
- For portable models, your dealer or other person experienced in proper outboard motor mounting should show you how to mount your motor.

Mount the outboard motor on the center line (keel line) of the boat, and ensure that the boat itself is well balanced. Otherwise the boat will be hard to steer. For boats without a keel or which are asymmetrical, consult your dealer.

Mounting height (boat bottom)
To run your boat at optimum efficiency, the water resistance (drag) of the boat and outboard motor must be made as little as possible. The mounting height of the outboard motor is:

1. Center line (keel line)
Operation

motor greatly affects the water resistance. If the mounting height is too high, cavitation tends to occur, thus reducing the propulsion; and if the propeller tips cut the air, the engine speed will rise abnormally and cause the engine to overheat. If the mounting height is too low, the water resistance will increase and thereby reduce engine efficiency. Mount the outboard motor so that the anti-cavitation plate is in alignment with the bottom of the boat.

NOTE:
- The optimum mounting height of the outboard motor is affected by the boat/motor combination and the desired use. Test runs at different heights can help determine the optimum mounting height. Consult your Yamaha dealer or boat manufacturer for further information on determining the proper mounting height.
- For instructions on setting the trim angle of the outboard motor, see page 41.

Breaking in engine

Your new engine requires a period of break-in to allow mating surfaces of moving parts to wear in evenly. Correct break-in will help ensure proper performance and longer engine life.

CAUTION:
Failure to follow the break-in procedure could result in reduced engine life or even severe engine damage.

Procedure for 4-stroke models

Run the engine under load (in gear with a propeller installed) for 10 hours as follows.
1. First hour:
   Run the engine at 2000 r/min or at approximately half throttle.
2. Second hour:
   Run the engine at 3000 r/min or at approximately three-quarter throttle.
3. Remaining eight hours:
   Run the engine at any speed. However, avoid operating at full throttle for more than 5 minutes at a time.
4. After the first 10 hours:
   Operate the engine normally.

Preoperation checks

WARNING
If any item in the preoperation check is not working properly, have it inspected and repaired before operating the outboard motor. Otherwise an accident could occur.

CAUTION:
Do not start the engine out of water. Overheating and serious engine damage can occur.

Fuel

- Check to be sure you have plenty of fuel for your trip.
- Make sure there are no fuel leaks or gaso-
line fumes.
- Check fuel line connections to be sure they are tight (if equipped Yamaha fuel tank or boat tank).
- Be sure the fuel tank is positioned on a secure, flat surface, and that the fuel line is not twisted or flattened, or likely to contact sharp objects (if equipped Yamaha fuel tank or boat tank).
- Check the water in the fuel filter with the water separator warning device. Place the gear shift lever in neutral and turn the main switch to "ON" (on). If the buzzer sounds and the water separator warning indicator blinks, consult your Yamaha dealer immediately.

Controls
- Check throttle, shift, and steering for proper operation before starting the engine.
- The controls should work smoothly, without binding or unusual free play.
- Look for loose or damaged connections.
- Check operation of the starter and stop switches when the outboard motor is in the water.

Engine
- Check the engine and engine mounting.
- Look for loose or damaged fasteners.
- Check the propeller for damage.
- Check that the battery is in good condition and the battery connections are secure.

Checking the engine oil level
1. Put the outboard motor in an upright position (not tilted).
2. Remove oil dipstick and wipe it clean.
3. Completely insert the dipstick and remove it again.
4. Check the oil level using the dipstick to be sure the level falls between the upper and lower marks. Fill with oil if it is below the lower mark, or drain to the specified level if it is above the upper mark.

Filling fuel

WARNING
Gasoline and its vapors are highly flammable and explosive. Keep away from sparks, cigarettes, flames, or other sources of ignition.
Operation

1. Remove the fuel tank cap.
2. Carefully fill the fuel tank.
3. Securely close the cap after filling the tank. Wipe up any spilled fuel.

Fuel tank capacity:
24 L (6.34 US gal) (5.28 Imp.gal)

Operating engine

Feeding fuel (portable tank)

**WARNING**

- Before starting the engine, make sure that the boat is tightly moored and that you can steer clear of any obstructions. Be sure there are no swimmers in the water near you.
- When the air vent screw is loosened, gasoline vapor will be released. Gasoline is highly flammable, and its vapors are flammable and explosive. Refrain from smoking, and keep away from open flames and sparks while loosening the air vent screw.
- This product emits exhaust gases which contain carbon monoxide, a colorless, odorless gas which could cause brain damage or death when inhaled. Symptoms include nausea, dizziness, and drowsiness. Keep cockpit and cabin areas well ventilated. Avoid blocking exhaust outlets.

1. If there is an air vent screw on the fuel tank cap, loosen it 2 or 3 turns.
2. If there is a fuel joint on the motor, firmly connect the fuel line to the joint. Then firmly connect the other end of the fuel line to the joint on the fuel tank.
3. If a steering friction adjuster is provided on your outboard motor, securely attach...
the fuel line to the fuel line clamp.

**NOTE:**
During engine operation place the tank horizontally, otherwise fuel cannot be drawn from the fuel tank.

4. Squeeze the primer pump with the outlet end up until you feel it become firm.

**WARNING**
- Attach the engine stop switch lanyard to a secure place on your clothing, or your arm or leg while operating.
- Do not attach the lanyard to clothing that could tear loose. Do not route the lanyard where it could become entangled, preventing it from functioning.
- Avoid accidentally pulling the lanyard during normal operation. Loss of engine power means the loss of most steering control. Also, without engine power, the boat could slow rapidly. This could cause people and objects in the boat to be thrown forward.

---

**Starting engine**

**Electric start / prime start models**

1. Place the gear shift lever in neutral.

**NOTE:**
The start-in-gear protection device prevents the engine from starting except when in neutral.

2. Attach the engine stop switch lanyard to a secure place on your clothing, or your arm or leg. Then install the lock plate on the other end of the lanyard into the engine stop switch.

3. Place the throttle grip in the "START" (start) position. After the engine starts, return the throttle to the fully closed position.
Operation

4. Turn the main switch to “START” (start), and hold it for a maximum of 5 seconds.

5. Immediately after the engine starts, release the main switch and allow it to return to “ON” (on).

**CAUTION:**
- Never turn the main switch to “START” (start) while the engine is running.
- Do not keep the starter motor turning for more than 5 seconds. If the starter motor is turned continuously for more than 5 seconds, the battery will be quickly discharged, thus making it impossible to start the engine. The starter can also be damaged. If the engine will not start after 5 seconds of cranking, return the main switch to “ON” (on), wait 10 seconds, then crank the engine again.

**NOTE:**
- When the engine is cold, it needs to be warmed up. For further information, see page 38.
- If the engine is warm and fails to start, open the throttle slightly and try to start the engine again. If the engine still fails to start, see page 71.

**EMU27662**
Electric start and remote control models

1. Place the remote control lever in neutral.

**NOTE:**
- The start-in-gear protection device prevents the engine from starting except when in neutral.

2. Attach the engine stop switch lanyard to a secure place on your clothing, or your arm or leg. Then install the lock plate on the other end of the lanyard into the engine stop switch.

**WARNING**
- Attach the engine stop switch lanyard to a secure place on your clothing, or your arm or leg while operating.
- Do not attach the lanyard to clothing that could tear loose. Do not route the lanyard where it could become entan-
Avoid accidentally pulling the lanyard during normal operation. Loss of engine power means the loss of most steering control. Also, without engine power, the boat could slow rapidly. This could cause people and objects in the boat to be thrown forward.

3. Turn the main switch to "ON" (on).
4. Turn the main switch to "START" (start), and hold it for a maximum of 5 seconds.

5. Immediately after the engine starts, release the main switch and allow it to return to "ON" (on).

**CAUTION:**
- Never turn the main switch to "START" (start) while the engine is running.
- Do not keep the starter motor turning for more than 5 seconds. If the starter motor is turned continuously for more than 5 seconds, the battery will be quickly discharged, thus making it impossible to start the engine. The starter can also be damaged. If the engine will not start after 5 seconds of cranking, return the main switch to "ON" (on), wait 10 seconds, then crank the engine again.

**NOTE:**
- When the engine is cold, it needs to be
Operation

warmed up. For further information, see page 38.

- If the engine is warm and fails to start, open the throttle slightly and try to start the engine again. If the engine still fails to start, see page 71.

Warming up engine

Manual start and electric start models

1. After starting the engine, allow it to idle for 3 minutes to warm up. Failure to do so will shorten engine life.
2. Be sure the low oil pressure warning indicator goes off after starting the engine.
3. Check for a steady flow of water from the cooling water pilot hole.

CAUTION:

- If the low oil pressure warning indicator does not go off after the engine starts, stop the engine. Otherwise serious engine damage could occur. Check the oil level and add oil if necessary. Consult your Yamaha dealer if the cause for the low oil pressure warning indicator cannot be found.
- A continuous flow of water from the pilot hole shows that the water pump is pumping water through the cooling passages. If water is not flowing out of the pilot hole at all times while the engine is running, overheating and serious damage could occur. Stop the engine and check whether the cooling water inlet on the lower case or the cooling water pilot hole is blocked. Consult your Yamaha dealer if the problem cannot be located and corrected.

Shifting

WARNING

Before shifting, make sure there are no swimmers or obstacles in the water near you.

CAUTION:

To change the boat direction or shifting position from forward to reverse or vice versa, first close the throttle so that the engine idles (or runs at low speeds).

Forward (tiller handle and remote control models)

Tiller handle models

1. Place the throttle grip in the fully closed position.
2. Move the gear shift lever quickly and
Operation

Remote control models
1. Pull up the neutral interlock trigger (if equipped) and move the remote control lever quickly and firmly from neutral to forward.

Reverse (automatic reverse lock and power trim and tilt models)

**WARNING**

When operating in reverse, go slowly. Do not open the throttle more than half. Otherwise the boat could become unstable, which could result in loss of control and an accident.

Tiller handle models
1. Place the throttle grip in the fully closed position.

2. Move the gear shift lever quickly and firmly from neutral to reverse.

Remote control models
1. Pull up the neutral interlock trigger (if equipped) and move the remote control lever quickly and firmly from neutral to reverse.
Operation

To increase the trolling speed, press the “UP” switch.
To decrease the trolling speed, press the “DN” switch.

NOTE:
- The trolling speed changes approximately 50 r/min each time a switch is pressed.
- If the trolling speed has been adjusted, the engine returns to the normal trolling speed when the engine is stopped and restarted or when the engine speed exceeds approximately 3000 r/min.

Stopping engine

Before stopping the engine, first let it cool off for a few minutes at idle or low speed. Stopping the engine immediately after operating at high speed is not recommended.

Procedure

1. Push and hold the engine stop button or turn the main switch to “OFF” (off).

Trolling

Adjusting trolling speed

The trolling speed on outboard motors equipped with the variable trolling RPM switches can be adjusted approximately 50 r/min with each press of a switch.
Operation

2. After stopping the engine, disconnect the fuel line if there is a fuel joint on the outboard motor.

3. Tighten the air vent screw on the fuel tank cap (if equipped).

4. Remove the key if the boat will be left unattended.

NOTE: The engine can also be stopped by pulling the lanyard and removing the lock plate from the engine stop switch, then turning the main switch to “OFF” (off).

Trimming outboard motor

The trim angle of the outboard motor helps determine the position of the bow of the boat in the water. Correct trim angle will help improve performance and fuel economy while reducing strain on the engine. Correct trim angle depends upon the combination of boat, engine, and propeller. Correct trim is also affected by variables such as the load in the boat, sea conditions, and running speed.

WARNING

Excessive trim for the operating conditions (either trim up or trim down) can cause boat instability and can make steering the boat more difficult. This increases the possibility of an accident. If the boat begins to feel unstable or is hard to steer, slow down and/or readjust the trim angle.
Operation

Adjusting trim angle
Power trim and tilt models

**WARNING**

- Be sure all people are clear of the outboard motor when adjusting the tilt angle, also be careful not to pinch any body parts between the drive unit and clamp bracket.
- Use caution when trying a trim position for the first time. Increase speed gradually and watch for any signs of instability or control problems. Improper trim angle can cause loss of control.
- If equipped with a power trim and tilt switch located on the bottom cowling, use the switch only when the boat is at a complete stop with the engine off. Do not adjust the trim angle with this switch while the boat is moving.

Adjust the outboard motor trim angle using the power trim and tilt switch.

1. Power trim and tilt switch

To raise the bow (trim-out), press the switch “UP” (up).
To lower the bow (trim-in), press the switch “DN” (down).
Make test runs with the trim set to different angles to find the position that works best for your boat and operating conditions.

**Adjusting boat trim**

When the boat is on plane, a bow-up attitude results in less drag, greater stability and efficiency. This is generally when the keel line of the boat is up about 3 to 5 degrees. With the bow up, the boat may have a greater tendency to steer to one side or the other. Compensate for this as you steer. The trim tab can also be adjusted to help offset this effect. When the bow of the boat is down, it is easier to accelerate from a standing start onto plane.

**Bow Up**

Too much trim-out puts the bow of the boat too high in the water. Performance and economy are decreased because the hull of the boat is pushing the water and there is more air drag. Excessive trim-out can also cause the propeller to ventilate, which reduces performance further, and the boat may “porpoise” (hop in the water), which could throw the operator and passengers overboard.

**Bow Down**

Too much trim-in causes the boat to “plow” through the water, decreasing fuel economy and making it hard to increase speed. Operating with excessive trim-in at higher speeds also makes the boat unstable. Resistance at the bow is greatly increased, heightening the danger of “bow steering” and making operation difficult and dangerous.

**NOTE:**
Depending on the type of boat, the outboard motor trim angle may have little effect on the trim of the boat when operating.

**Tilting up and down**

If the engine will be stopped for some time or if the boat is moored in shallows, the outboard motor should be tilted up to protect the propeller and casing from damage by collision with obstructions, and also to reduce
Operation

salt corrosion.

**WARNING**
Be sure all people are clear of the outboard motor when tilting up and down, also be careful not to pinch any body parts between the drive unit and engine bracket.

**WARNING**
Leaking fuel is a fire hazard. If there is a fuel joint on the outboard motor, disconnect the fuel line or close the fuel cock if the engine will be tilted for more than a few minutes. Otherwise fuel may leak.

**CAUTION:**
- Before tilting the outboard motor, stop the engine by following the procedure on page 40. Never tilt the outboard motor while the engine is running. Severe damage from overheating can result.
- Do not tilt up the engine by pushing the tiller handle (if equipped) because this could break the handle.

Procedure for tilting up (power trim and tilt models / power tilt models)
1. Place the remote control lever / gear shift lever in neutral.
2. Disconnect the fuel line from the outboard motor or close the fuel cock.
3. Press the power trim and tilt switch / power tilt switch “UP” (up) until the outboard motor has tilted up completely.
4. Push the tilt support knob into the clamp bracket or pull the tilt support lever toward you to support the engine.

**WARNING**

After tilting the outboard motor, be sure to support it with the tilt support knob or tilt support lever. Otherwise the outboard motor could fall back down suddenly if oil in the power trim and tilt unit loses pressure.

5. Models equipped with trim rods: Once the outboard motor is supported with the tilt support lever, press the power trim and tilt switch / power tilt switch “DN” (down) to retract the trim rods.

**CAUTION:**

Be sure to retract the trim rods completely during mooring. This protects the rods from marine growth and corrosion which could damage the power trim and tilt mechanism.

**Procedure for tilting down (power trim and tilt models / power tilt models)**

1. Push the power trim and tilt switch / power tilt switch “UP” (up) until the outboard motor is supported by the tilt rod and the
Operation

1. Operation

2. Release the tilt support lever or pull out the tilt support knob.

3. Push the power trim and tilt switch / power tilt switch "DN" (down) to lower the outboard motor to the desired position.

Cruising in shallow water

The outboard motor can be tilted up partially to allow operation in shallow water.

Power trim and tilt models / power tilt models

The outboard motor can be tilted up partially to allow operation in shallow water.

WARNING

- Place the gear shift in neutral before setting up for shallow water cruising.
- Return the outboard motor to its normal position as soon as the boat is back in deeper water.

CAUTION:

- Do not tilt the outboard motor up so that the cooling water inlet on the lower unit is above the surface of the water when set-
ting up for and cruising in shallow water. Otherwise severe damage from overheating can result.

Procedure for power trim and tilt / power tilt models
1. Place the remote control lever / gear shift lever in neutral.

2. Slightly tilt the outboard motor up to the desired position using the power trim and tilt switch / power tilt switch.
3. To return the outboard motor to the normal running position, press the power trim and tilt switch / power tilt switch and slowly tilt the outboard motor down.

**Cruising in other conditions**

**Cruising in salt water**

After operating in salt water, flush the cooling water passages with fresh water to prevent them from becoming clogged with salt deposits.

**NOTE:**

For cooling system flushing instructions, see page 51.

**Cruising in turbid water**

Yamaha strongly recommends that you use the optional chromium-plated water pump kit (not available for some models) if you use the outboard motor in turbid or muddy water conditions.
## Specifications

**NOTE:**

“(AL)” stated in the specification data below represents the numerical value for the aluminum propeller installed. Likewise, “(SUS)” represents the value for stainless steel propeller installed and “(PL)” for plastic propeller installed.

- FT60DET 670.0 cm³ (22.65 US oz) (23.63 Imp.oz)

Tightening torque for engine:
Spark plug:
  18.0 Nm (13.3 ft-lb) (1.84 kgf-m)
Propeller nut:
  35.0 Nm (25.8 ft-lb) (3.57 kgf-m)
Engine oil drain bolt:
  18.0 Nm (13.3 ft-lb) (1.84 kgf-m)
Engine oil filter:
  18.0 Nm (13.3 ft-lb) (1.84 kgf-m)
Maintenance

Transporting and storing outboard motor

**WARNING**
- Leaking fuel is a fire hazard. When transporting and storing the outboard motor, close the air vent screw and fuel cock to prevent fuel from leaking.
- **USE CARE** when transporting fuel tank, whether in a boat or car.
- **DO NOT** fill fuel container to maximum capacity. Gasoline will expand considerably as it warms up and can build up pressure in the fuel container. This can cause fuel leakage and a potential fire hazard.

**WARNING**
Never get under the lower unit while it is tilted, even if a motor support bar is used. Severe injury could occur if the outboard motor accidentally falls.

**CAUTION:**
Do not use the tilt support lever or knob when trailering the boat. The outboard motor could shake loose from the tilt support and fall. If the motor cannot be trailered in the normal running position, use an additional support device to secure it in the tilt position.

The outboard motor should be trailered and stored in the normal running position. If there is insufficient road clearance in this position, then trail the outboard motor in the tilt position using a motor support device such as a transom saver bar. Consult your Yamaha dealer for further details.

Storing outboard motor

When storing your Yamaha outboard motor for prolonged periods of time (2 months or longer), several important procedures must be performed to prevent excessive damage. It is advisable to have your outboard motor serviced by an authorized Yamaha dealer prior to storage. However, you, the owner, with a minimum of tools, can perform the following procedures.

**CAUTION:**
- To prevent problems which can be caused by oil entering the cylinder from the sump, keep the outboard motor in the attitude shown when transporting and storing it. If storing or transporting the outboard motor on its side (not upright), put it on a cushion after draining the engine oil.
- Do not place the outboard motor on its side before the cooling water has drained from it completely, otherwise water may enter the cylinder through the exhaust port and cause engine trouble.
- Store the outboard motor in a dry, well-ventilated place, not in direct sunlight.
- Drain the remaining gasoline from the vapor separator. Gasoline left in the va-
Maintenance

Por separator for a prolonged period of time will break down and could cause damage to the fuel line.

Procedure

Flushing with the flushing attachment
1. Wash the outboard motor body using fresh water. For further information, see page 55.
2. Disconnect the fuel line from the motor or shut off the fuel cock, if equipped.
3. Remove the top cowling and propeller.
4. Install the flushing attachment over the cooling water inlet.

CAUTION:

Do not run the engine without supplying it with cooling water. Either the engine water pump will be damaged or the engine will be damaged from overheating. Before starting the engine, be sure to supply water to the cooling water passages.

CAUTION:

Avoid running the outboard motor at high speed while on the flushing attachment, otherwise overheating could occur.

WARNING

- Do not touch or remove electrical parts when starting or during operation.
- Keep hands, hair, and clothes away from the flywheel and other rotating parts while the engine is running.

NOTE:

- When using the flushing attachment, maintain adequate water pressure and a steady water flow.
- If the overheat warning device is activated, turn the engine off, and consult your Yamaha dealer.

6. Run the engine at a fast idle for a few minutes in neutral position.
7. Just prior to turning off the engine, quickly spray “Fogging Oil” alternately into the intake silencer or the fogging hole of the silencer cover, if equipped. When properly done, the engine will smoke excessively and almost stall.
8. Drain the remained gasoline in the vapor separator with a container. Loosen the drain screw, and then remove the cap. Push in the air valve with a screwdriver to introduce air into the float chamber, so that the gasoline will drain smoothly. Then, tighten the drain screw.

1. Flushing attachment
Maintenance

9. Remove the flushing attachment.
10. Install the top cowling.
11. If “Fogging Oil” is not available, turn off the engine after the 6 step. Then perform the 8 step procedure.
12. Drain the cooling water completely out of the motor. Clean the body thoroughly.
13. If the “Fogging Oil” is not available, remove the spark plug(s). Pour a teaspoonful of clean engine oil into each cylinder. Crank several times manually. Replace the spark plug(s).

NOTE: A flushing attachment is available from your Yamaha dealer.

Lubrication
1. Grease the spark plug threads and install the spark plug(s) and torque to proper specification. For information on spark plug installation, see page 59.
2. Change the gear oil. For instructions, see page 66. Inspect the oil for the presence of water that indicates a leaky seal. Seal replacement should be performed by an authorized Yamaha dealer prior to use.
3. Grease all grease fittings. For further details, see page 58.

Battery care

WARNING
Battery electrolytic fluid is dangerous; it contains sulfuric acid and therefore is poisonous and highly caustic. Always follow these preventive measures:
• Avoid bodily contact with electrolytic fluid as it can cause severe burns or permanent eye injury.
• Wear protective eye gear when handling or working near batteries.
Antidote (EXTERNAL):
• SKIN - Flush with water.
• EYES - Flush with water for 15 minutes and get immediate medical attention.
Antidote (INTERNAL):
• Drink large quantities of water or milk followed by milk of magnesia, beaten egg, or vegetable oil. Get immediate medical attention.
Batteries also generate explosive hydrogen gas; therefore, you should always
Maintenance

follow these preventive measures:
- Charge batteries in a well-ventilated area.
- Keep batteries away from fire, sparks, or open flames (for example: welding equipment, lighted cigarettes, and so on.)
- DO NOT SMOKE when charging or handling batteries.

KEEP BATTERIES AND ELECTROLYTIC FLUID OUT OF REACH OF CHILDREN.

Batteries vary among manufacturers. Therefore the following procedures may not always apply. Consult your battery manufacturer's instructions.

Procedure
1. Disconnect and remove the battery from the boat. Always disconnect the black negative cable first to prevent the risk of shorting.
2. Clean the battery casing and terminals. Fill each cell to the upper level with distilled water.
3. Store the battery on a level surface in a cool, dry, well-ventilated place out of direct sunlight.
4. Once a month, check the specific gravity of the electrolyte and recharge as required to prolong battery life.

EMU28442
Flushing power unit
Perform this procedure right after operation for the most thorough flushing.

CAUTION:
Do not perform this procedure while the engine is running. The water pump may be damaged and severe damage from overheating can result.

1. After shutting off the engine, unscrew the garden hose connector from the fitting on the bottom cowling.
2. Screw the garden hose adapter onto a garden hose, which is connected to a fresh water supply, and then connect it to the garden hose connector.
3. With the engine off, turn on the water tap and let the water flush through the cooling passages for about 15 minutes. Turn off the water and disconnect the garden hose adapter from the garden hose connector.
4. Reinstall the garden hose connector onto the fitting on the bottom cowling. Tighten the connector securely.

ECM00540
CAUTION:
Do not leave the garden hose connector loose on the bottom cowling fitting or let...
the hose hang free during normal operation. Water will leak out of the connector instead of cooling the engine, which can cause serious overheating. Be sure the connector is tightened securely on the fitting after flushing the engine.

NOTE:
- When flushing the engine with the boat in the water, tilting up the outboard motor until it is completely out of the water will achieve better results.
- For cooling system flushing instructions, see page 51.

Cleaning the outboard motor
After use, wash the exterior of the outboard motor with fresh water. Flush the cooling system with fresh water.

NOTE:
For cooling system flushing instructions, see page 51.

Checking painted surface of motor
Check the motor for scratches, nicks, or flaking paint. Areas with damaged paint are more likely to corrode. If necessary, clean and paint the areas. A touch-up paint is available from your Yamaha dealer.
Maintenance

Maintenance chart
Frequency of maintenance operations may be adjusted according to the operating conditions, but the following table gives general guidelines. Refer to the sections in this chapter for explanations of each owner-specific action.

NOTE:
When operating in salt water, turbid or muddy water, the engine should be flushed with clean water after each use.

The “●” symbol indicates the check-ups which you may carry out yourself. The “○” symbol indicates work to be carried out by your Yamaha dealer.

Greasing
Yamaha grease A (water resistant grease)
Yamaha grease D (corrosion resistant grease; for propeller shaft)
F50F, FT50G, F60C, FT60D
Cleaning and adjusting spark plug

When removing or installing a spark plug, be careful not to damage the insulator. A damaged insulator could allow external sparks, which could lead to explosion or fire.

The spark plug is an important engine component and is easy to inspect. The condition of the spark plug can indicate something about the condition of the engine. For example, if the center electrode porcelain is very white, this could indicate an intake air leak or carburetion problem in that cylinder. Do not attempt to diagnose any problems yourself. Instead, take the outboard motor to a Yamaha dealer. You should periodically remove and inspect the spark plug because heat and deposits will cause the spark plug to slowly break down and erode. If electrode erosion becomes excessive, or if carbon and other deposits are excessive, you should re-
Maintenance

Place the spark plug with another of the correct type.

Standard spark plug:
DPR6EB-9

Before fitting the spark plug, measure the electrode gap with a wire thickness gauge; adjust the gap to specification if necessary.

NOTE:
If a torque-wrench is not available when you are fitting a spark plug, a good estimate of the correct torque is 1/4 to 1/2 a turn past finger-tight. Have the spark plug adjusted to the correct torque as soon as possible with a torque-wrench.

Checking fuel system

WARNING
Gasoline and its vapors are highly flammable and explosive. Keep away from sparks, cigarettes, flames, or other sources of ignition.

WARNING
Leaking fuel can result in fire or explosion.
- Check for fuel leakage regularly.
- If any fuel leakage is found, the fuel system must be repaired by a qualified mechanic. Improper repairs can make the outboard unsafe to operate.

Check the fuel lines for leaks, crack, or malfunction. If a problem is found, your Yamaha dealer or other qualified mechanic should repair it immediately.
Maintenance

Checkpoints
- Fuel system parts leakage
- Fuel line joint leakage
- Fuel line cracks or other damage
- Fuel connector leakage

**Inspecting idling speed**

**WARNING**
- Do not touch or remove electrical parts when starting or during operation.
- Keep hands, hair, and clothes away from the flywheel and other rotating parts while the engine is running.

**CAUTION:**
This procedure must be performed while the outboard motor is in the water. A flushing attachment or test tank can be used.

A diagnostic tachometer should be used for this procedure. Results may vary depending on whether testing is conducted with the flushing attachment, in a test tank, or with the outboard motor in the water.

1. Start the engine and allow it to warm up fully in neutral until it is running smoothly.

**NOTE:**
Correct idling speed inspection is only possible if the engine is fully warmed up. If not warmed up fully, the idle speed will measure higher than normal. If you have difficulty verifying the idle speed, or the idle speed requires adjustment, consult a Yamaha dealer or other qualified mechanic.

2. Verify whether the idle speed is set to specification. For idle speed specifications, see page 49.

**Changing engine oil**

**WARNING**
- Avoid draining the engine oil immediately after stopping the engine. The oil is hot and should be handled with care to avoid burns.
- Be sure the outboard motor is securely fastened to the transom or a stable stand.

**CAUTION:**
- Do not overfill the oil, and be sure the outboard motor is upright (not tilted) when checking and changing the engine oil.
- If the oil level is above the upper level mark, drain until the level meets the specified capacity. Overfilling the oil could cause leakage or damage.

**CAUTION:**
Change the engine oil after the first 10 hours of operation, and every 100 hours or at 6-month intervals thereafter. Otherwise the engine will wear quickly.

**NOTE:**
Change the engine oil when the oil is still warm.

1. Put the outboard motor in an upright position (not tilted).
Maintenance

2. Prepare a suitable container that holds a larger amount than the engine oil capacity. Loosen and remove the drain screw while holding the container under the drain hole. Then remove the oil filler cap. Let the oil drain completely. Wipe up any spilled oil immediately.

3. Put a new gasket on the oil drain screw. Apply a light coat of oil to the gasket and install the drain screw.

Drain screw tightening torque:
18.0 Nm (13.3 ft-lb) (1.84 kgf-m)

NOTE:
If a torque wrench is not available when you are installing the drain screw, finger tighten the screw just until the gasket comes into contact with the surface of the drain hole.

4. Add the correct amount of oil through the filler hole. Install the filler cap.

Recommended engine oil:
4-stroke outboard motor oil
Engine oil quantity (excluding oil filter):
2.5 L (2.64 US qt) (2.20 Imp.qt)

5. Start the engine and watch to make sure the low oil pressure warning indicator (if equipped) turns off. Make sure that there are no oil leaks.

CAUTION:
If the low oil pressure warning indicator does not turn off or if there are oil leaks, stop the engine and find the cause. Continued operation with a problem could cause severe engine damage. Consult your Yamaha dealer if the problem cannot be located and corrected.

6. Turn off the engine and wait 3 minutes. Recheck the oil level using the dipstick to be sure the level falls between the upper and lower marks. Fill with oil if it is below the lower mark, or drain to the
Maintenance

specified level if it is above the upper mark.

1. Lower level mark
2. Oil dipstick
3. Upper level mark

7. Dispose of used oil according to local regulations.

NOTE:
- For more information on the disposal of used oil, consult your Yamaha dealer.
- Change the oil more often when operating the engine under adverse conditions such as extended trolling.

Checking wiring and connectors
- Check that each grounding wire is properly secured.
- Check that each connector is engaged securely.

Exhaust leakage
Start the engine and check that no exhaust leaks from the joints between the exhaust cover, cylinder head, and body cylinder.

Water leakage
Start the engine and check that no water leaks from the joints between the exhaust cover, cylinder head, and body cylinder.

Engine oil leakage
Check for oil leaks on the around the engine.

NOTE: ____________________________
If any leaks are found, consult your Yamaha dealer.

Checking power trim and tilt / power tilt system

WARNING
- Never get under the lower unit while it is tilted, even when the tilt support lever is locked. Severe injury could occur if the outboard motor accidentally fails.
- Make sure no one is under the outboard motor before performing this test.

1. Check the power trim and tilt unit / power tilt unit for any sign of oil leaks.
2. Operate each of the power trim and tilt switches / power tilt switches to check that all switches work.
3. Tilt the outboard motor up and check that the trim and tilt rod / the tilt rod is pushed out completely.
4. Check that the trim and tilt rod / the tilt rod is free of corrosion or other flaws.
5. Tilt the outboard motor down. Check
Maintenance

that the trim and tilt rod / the tilt rod operates smoothly.

NOTE:
Consult your Yamaha dealer if any operation is abnormal.

Checking propeller

WARNING
You could be seriously injured if the engine accidentally starts when you are near the propeller.

• Before inspecting, removing, or installing the propeller, remove the spark plug caps from the spark plugs. Also, place the shift control in neutral, turn the main switch to “OFF” (off) and remove the key, and remove the lanyard from the engine stop switch. Turn off the battery cut-off switch if your boat has one.

• Do not use your hand to hold the propeller when loosening or tightening the propeller nut. Put a wood block between the anti-cavitation plate and the propeller to prevent the propeller from turning.

Checkpoints

• Check each of the propeller blades for wear, erosion from cavitation or ventilation, or other damage.

• Check the propeller shaft for damage.

• Check the splines / shear pin for wear or damage.

• Check for fish line tangled around the propeller shaft.

• Check the propeller shaft oil seal for damage.

NOTE:
If the shear pin equipped: it is designed to break if the propeller hits a hard underwater obstacle to help protect the propeller and drive mechanism. The propeller will then spin freely on the shaft. If this happens, the shear pin must be replaced.
Maintenance

Removing the propeller

Spline models
1. Straighten the cotter pin and pull it out using a pair of pliers.
2. Remove the propeller nut, washer, and spacer (if equipped).

Installing the Propeller

CAUTION:
- Be sure to install the thrust washer before installing the propeller, otherwise the lower case and propeller boss could be damaged.
- Be sure to use a new cotter pin and bend the ends over securely. Otherwise the propeller could come off during operation and be lost.

1. Apply Yamaha marine grease or a corrosion resistant grease to the propeller shaft.
2. Install the spacer (if equipped), thrust washer, and propeller on the propeller shaft.
3. Install the spacer (if equipped) and the washer. Tighten the propeller nut to the specified torque.
4. Align the propeller nut with the propeller shaft hole. Insert a new cotter pin in the hole and bend the cotter pin ends.

NOTE:
If the propeller nut does not align with the propeller shaft hole after tightening to the
Maintenance

specified torque, tighten the nut further to align it with the hole.

Changing gear oil

**WARNING**

- Be sure the outboard motor is securely fastened to the transom or a stable stand. You could be severely injured if the outboard motor falls on you.
- Never get under the lower unit while it is tilted, even when the tilt support lever or knob is locked. Severe injury could occur if the outboard motor accidentally falls.

1. Tilt the outboard motor so that the gear oil drain screw is at the lowest point possible.
2. Place a suitable container under the gear case.
3. Remove the gear oil drain screw and gasket.

**NOTE:**

- If a magnetic gear oil drain screw is equipped, remove all metal particles from the screw before installing it.
- Always use new gaskets. Do not reuse the removed gaskets.

4. Remove the oil level plug and gasket to allow the oil to drain completely.

**CAUTION:**

Inspect the used oil after it has been drained. If the oil is milky, water is getting into the gear case which can cause gear damage. Consult a Yamaha dealer for repair of the lower unit seals.

**NOTE:**

For disposal of used oil, consult your Yamaha dealer.

5. With the outboard motor in a vertical position, and using a flexible or pressurized filling device, inject the gear oil into the gear oil drain screw hole.

**Recommended gear oil:**

Hypoid gear oil SAE#90

**Gear oil quantity:**

- F50FEHT 430.0 cm³ (14.54 US oz) (15.17 Imp.oz)
- F50FET 430.0 cm³ (14.54 US oz) (15.17 Imp.oz)
- F60CEHT 430.0 cm³ (14.54 US oz) (15.17 Imp.oz)
- F60CET 430.0 cm³ (14.54 US oz) (15.17 Imp.oz)
- FT50GET 670.0 cm³ (22.65 US oz) (23.63 Imp.oz)
- FT60DET 670.0 cm³ (22.65 US oz) (23.63 Imp.oz)
6. Put a new gasket on the oil level plug. When the oil begins to flow out of the oil level plug hole, insert and tighten the oil level plug.

7. Put a new gasket on the gear oil drain screw. Insert and tighten the gear oil drain screw.

Cleaning fuel tank

**WARNING**

Gasoline is highly flammable, and its vapors are flammable and explosive.

- If you have any question about properly doing this procedure, consult your Yamaha dealer.
- Keep away from sparks, cigarettes, flames, or other sources of ignition when cleaning the fuel tank.
- Remove the fuel tank from the boat before cleaning it. Work only outdoors in an area with good ventilation.
- Wipe up any spilled fuel immediately.
- Reassemble the fuel tank carefully. Improper assembly can result in a fuel leak, which could result in a fire or explosion hazard.
- Dispose of old gasoline according to local regulations.

1. Empty the fuel tank into an approved container.

2. Pour a small amount of suitable solvent into the tank. Install the cap and shake the tank. Drain the solvent completely.

3. Remove the screws holding the fuel joint assembly. Pull the assembly out of the tank.

4. Clean the filter (located on the end of the suction pipe) in a suitable cleaning solvent. Allow the filter to dry.

5. Replace the gasket with a new one. Reinstall the fuel joint assembly and tighten
Maintenance

the screws firmly.

Inspecting and replacing anode(s)
Yamaha outboard motors are protected from corrosion by sacrificial anodes. Inspect the external anodes periodically. Remove scales from the surfaces of the anodes. Consult a Yamaha dealer for replacement of external anodes.

CAUTION:
Do not paint anodes, as this would render them ineffective.

NOTE:
Inspect ground leads attached to external anodes on equipped models. Consult a Yamaha dealer for inspection and replacement of internal anodes attached to the power unit.

Checking battery (for electric start models)

WARNING
Battery electrolytic fluid is dangerous; it contains sulfuric acid and therefore is poisonous and highly caustic. Always follow these preventive measures:
- Avoid bodily contact with electrolytic fluid as it can cause severe burns or permanent eye injury.
- Wear protective eye gear when handling or working near batteries.
Antidote (EXTERNAL):
- SKIN - Flush with water.
- EYES - Flush with water for 15 minutes and get immediate medical attention.
Antidote (INTERNAL):
- Drink large quantities of water or milk followed by milk of magnesia, beaten egg, or vegetable oil. Get immediate medical attention.
Batteries also generate explosive hydrogen gas; therefore, you should always follow these preventive measures:
- Charge batteries in a well-ventilated area.
- Keep batteries away from fire, sparks, or open flames (for example: welding
Maintenance

- DO NOT SMOKE when charging or handling batteries.
- KEEP BATTERIES AND ELECTROLYTIC FLUID OUT OF REACH OF CHILDREN.

**CAUTION:**
- A poorly maintained battery will quickly deteriorate.
- Ordinary tap water contains minerals harmful to a battery, and should not be used for topping up.

1. Check the electrolyte level at least once a month. Fill to the manufacturer’s recommended level when necessary. Top up only with distilled water (or pure deionized water suitable to use in batteries).

2. Always keep the battery in a good state of charge. Installing a voltmeter will help you monitor your battery. If you will not use the boat for a month or more, remove the battery from the boat and store it in a cool, dark place. Completely recharge the battery before using it.

3. If the battery will be stored for longer than a month, check the specific gravity of the fluid at least once a month and recharge the battery when it is low.

**NOTE:**
Consult a Yamaha dealer when charging or re-charging batteries.

**Connecting the battery**

**WARNING**
Mount the battery holder securely in a dry, well-ventilated, vibration-free location in the boat. Install a fully charged battery in the holder.

**CAUTION:**
- Make sure the main switch (on applicable models) is “OFF” (off) before working on the battery.
- Reversal of the battery cables will damage the electrical parts.
- Connect the red battery cable first when installing the battery and disconnect the black battery cable first when removing it. Otherwise, the electrical parts can be damaged.
- The electrical contacts of the battery and cables must be clean and properly connected, or the battery will not start the engine.

Connect the red battery cable to the POSITIVE (+) terminal first. Then connect the black battery cable to the NEGATIVE (-) terminal.
Maintenance

Disconnecting the battery
Disconnect the BLACK cable from the NEGATIVE (-) terminal first. Then disconnect the RED cable from the POSITIVE (+) terminal.

Checking top cowling
Check the fitting of the top cowling by pushing it with both hands. If it is loose have it repaired by your Yamaha dealer.

Coating the boat bottom
A clean hull improves boat performance. The boat bottom should be kept as clean of marine growth as possible. If necessary, the boat bottom can be coated with an anti-fouling paint approved for your area to inhibit marine growth.

Do not use anti-fouling paint which includes copper or graphite. These paints can cause more rapid engine corrosion.
Trouble Recovery

Troubleshooting
A problem in the fuel, compression, or ignition systems can cause poor starting, loss of power, or other problems. This section describes basic checks and possible remedies, and covers all Yamaha outboard motors. Therefore some items may not apply to your model.

If your outboard motor requires repair, bring it to your Yamaha dealer.

If the engine trouble warning indicator is flashing, consult your Yamaha dealer.

Starter will not operate.
Q. Is battery capacity weak or low?
A. Check battery condition. Use battery of recommended capacity.

Q. Are battery connections loose or corroded?
A. Tighten battery cables and clean battery terminals.

Q. Is fuse for electric start relay or electric circuit blown?
A. Check for cause of electric overload and repair. Replace fuse with one of correct amperage.

Q. Are starter components faulty?
A. Have serviced by a Yamaha dealer.

Q. Is shift lever in gear?
A. Shift to neutral.

Engine will not start (starter operates).
Q. Is fuel tank empty?
A. Fill tank with clean, fresh fuel.

Q. Is fuel contaminated or stale?
A. Fill tank with clean, fresh fuel.

Q. Is fuel filter clogged?
A. Clean or replace filter.

Q. Is starting procedure incorrect?
A. See page 35.

Q. Has fuel pump malfunctioned?
A. Have serviced by a Yamaha dealer.

Q. Are spark plug(s) fouled or of incorrect type?
A. Inspect spark plug(s). Clean or replace with recommended type.

Q. Are spark plug cap(s) fitted incorrectly?
A. Check and re-fit cap(s).

Q. Is ignition wiring damaged or poorly connected?
A. Check wires for wear or breaks. Tighten all loose connections. Replace worn or broken wires.

Q. Are ignition parts faulty?
A. Have serviced by a Yamaha dealer.

Q. Is engine stop switch lanyard not attached?
A. Attach lanyard.

Q. Are engine inner parts damaged?
A. Have serviced by a Yamaha dealer.

Engine idles irregularly or stalls.
Q. Are spark plug(s) fouled or of incorrect type?
A. Inspect spark plug(s). Clean or replace with recommended type.
**Trouble Recovery**

Q. Is fuel system obstructed?
A. Check for pinched or kinked fuel line or other obstructions in fuel system.

Q. Is fuel contaminated or stale?
A. Fill tank with clean, fresh fuel.

Q. Is fuel filter clogged?
A. Clean or replace filter.

Q. Have ignition parts failed?
A. Have serviced by a Yamaha dealer.

Q. Has warning system activated?
A. Find and correct cause of warning.

Q. Is spark plug gap incorrect?
A. Inspect and adjust as specified.

Q. Is ignition wiring damaged or poorly connected?
A. Check wires for wear or breaks. Tighten all loose connections. Replace worn or broken wires.

Q. Is specified engine oil not being used?
A. Check and replace oil as specified.

Q. Is thermostat faulty or clogged?
A. Have serviced by a Yamaha dealer.

Q. Are carburetor adjustments incorrect?
A. Have serviced by a Yamaha dealer.

Q. Is fuel pump damaged?
A. Have serviced by a Yamaha dealer.

Q. Is air vent screw on fuel tank closed?
A. Open air vent screw.

Q. Is choke knob pulled out?
A. Return to home position.

Q. Is motor angle too high?
A. Return to normal operating position.

Q. Is carburetor clogged?
A. Have serviced by a Yamaha dealer.

Q. Is fuel joint connection incorrect?
A. Connect correctly.

Q. Is throttle valve adjustment incorrect?
A. Have serviced by a Yamaha dealer.

Q. Is battery cable disconnected?
A. Connect securely.

**Warning buzzer sounds or indicator lights.**

Q. Is cooling system clogged?
A. Check water intake for restriction.

Q. Is engine oil level low?
A. Fill oil tank with specified engine oil.

Q. Is heat range of spark plug incorrect?
A. Inspect spark plug and replace it with recommended type.

Q. Is specified engine oil not being used?
A. Check and replace oil with specified type.

Q. Is engine oil contaminated or deteriorated?
A. Replace oil with fresh, specified type.

Q. Is oil filter clogged?
A. Have serviced by a Yamaha dealer.

Q. Has oil feed/injection pump malfunctioned?
Trouble Recovery

A. Have serviced by a Yamaha dealer.

Q. Is load on boat improperly distributed?
   A. Distribute load to place boat on an even plane.

Q. Is water pump or thermostat faulty?
   A. Have serviced by a Yamaha dealer.

Q. Is there excess water in fuel filter cup?
   A. Drain filter cup.

Q. Are weeds or other foreign matter tangled on gear housing?
   A. Remove foreign matter and clean lower unit.

Q. Is fuel system obstructed?
   A. Check for pinched or kinked fuel line or other obstructions in fuel system.

Q. Is fuel filter clogged?
   A. Clean or replace filter.

Q. Is fuel contaminated or stale?
   A. Fill tank with clean, fresh fuel.

Q. Is spark plug gap incorrect?
   A. Inspect and adjust as specified.

Q. Is spark plug damaged or poorly connected?
   A. Check wires for wear or breaks. Tighten all loose connections. Replace worn or broken wires.

Q. Have electrical parts failed?
   A. Have serviced by a Yamaha dealer.

Q. Is specified fuel not being used?
   A. Replace fuel with specified type.

Q. Is specified engine oil not being used?
   A. Check and replace oil with specified type.

Q. Is thermostat faulty or clogged?
   A. Have serviced by a Yamaha dealer.

Q. Is air vent screw closed?
   A. Open the air vent screw.

Q. Is fuel pump damaged?
   A. Have serviced by a Yamaha dealer.

Q. Is engine power loss.
   Q. Is propeller damaged?
      A. Have propeller repaired or replaced.

   Q. Is propeller pitch or diameter incorrect?
      A. Install correct propeller to operate outboard at its recommended speed (r/min) range.

   Q. Is trim angle incorrect?
      A. Adjust trim angle to achieve most efficient operation.

   Q. Is motor mounted at incorrect height on transom?
      A. Have motor adjusted to proper transom height.

   Q. Has warning system activated?
      A. Find and correct cause of warning.

   Q. Is boat bottom fouled with marine growth?
      A. Clean boat bottom.

   Q. Are spark plug(s) fouled or of incorrect type?
      A. Inspect spark plug(s). Clean or replace with recommended type.
Trouble Recovery

Q. Is fuel joint connection incorrect?
A. Connect correctly.

Q. Is heat range of spark plug incorrect?
A. Inspect spark plug and replace it with recommended type.

Q. Is high pressure fuel pump drive belt broken?
A. Have serviced by a Yamaha dealer.

Q. Is engine not responding properly to shift lever position?
A. Have serviced by a Yamaha dealer.

Engine vibrates excessively.
Q. Is propeller damaged?
A. Have propeller repaired or replaced.

Q. Is propeller shaft damaged?
A. Have serviced by a Yamaha dealer.

Q. Are weeds or other foreign matter tangled on propeller?
A. Remove and clean propeller.

Q. Is motor mounting bolt loose?
A. Tighten bolt.

Q. Is steering pivot loose or damaged?
A. Tighten or have serviced by a Yamaha dealer.

Temporary action in emergency

Replacing fuse
If a fuse has blown, open the fuse holder and remove the fuse with a fuse puller. Replace it with a spare one of the proper amperage.

Be sure to use the specified fuse. An incorrect fuse or a piece of wire could allow excessive current flow. This could cause electric system damage and a fire hazard.

NOTE: Consult your Yamaha dealer if the new fuse immediately blows again.
**Trouble Recovery**

1. Fuse (20 A × 3, 30 A × 1)
2. Spare fuse (20 A × 3, 30 A × 1)
3. Fuse puller

**Power trim and tilt / power tilt will not operate**

If the engine cannot be tilted up or down with the power trim and tilt / the power tilt because of a discharged battery or a failure with the power trim and tilt unit / the power tilt unit, the engine can be tilted manually.

1. Loosen the manual valve screw by turning it counterclockwise until it stops.

**Water separator warning indicator blinks while cruising**

**WARNING**

- Gasoline is highly flammable, and its vapors are flammable and explosive.
- Do not perform this procedure on a hot or running engine. Allow the engine to cool.
- There will be fuel in the fuel filter. Keep away from sparks, cigarettes, flames or other sources of ignition.
- This procedure will allow some fuel to spill. Catch fuel in a rag. Wipe up any spilled fuel immediately.
- The fuel filter must be reassembled carefully with the O-ring, filter cup, and hoses in place. Improper assembly or replacement could result in a fuel leak, which could result in a fire or explosion hazard.

If the water separator warning indicator on the tachometer blinks, perform the following procedure.
Trouble Recovery

1. Stop the engine.
2. Remove the top cowling.
3. Remove the plastic tie.
4. Disconnect the water detection switch coupler.

**CAUTION:**
Be careful not to get any water on the water detection switch coupler, otherwise a malfunction could occur.

5. Unscrew the filter cup from the filter housing.

**NOTE:**
Be careful not to twist the water detection switch lead when unscrewing the filter cup.

6. Drain the water in the filter cup by soaking it up with a rag.

**NOTE:**
Properly dispose of the rag.

7. Firmly screw the filter cup onto the filter housing.

**NOTE:**
Be careful not to twist the water detection switch lead when screwsing the filter cup onto
Trouble Recovery

8. Connect the water detection switch coupler securely until a click is heard.

9. Fasten the water detection switch lead with the plastic tie.

10. Install the top cowling.

11. Start the engine and make sure that the water separator warning indicator remains off.

NOTE: Have a Yamaha dealer inspect the outboard motor after returning to port.

---

**Starter will not operate**

If the starter mechanism does not operate (the engine cannot be cranked with the starter), the engine can be started manually with an emergency starter rope. However, the engine cannot be started manually if the battery voltage is low. If the battery is discharged to 9 volts or below, the electric fuel pump will not operate.

**WARNING**

- Use this procedure only in an emergency to return to the nearest port for repairs.
- When the emergency starter rope is used to start the engine, the start-in-gear protection device does not operate. Make sure the remote control lever is in neutral. Otherwise the boat could unexpectedly start to move, which could result in an accident.
- Attach the engine stop switch lanyard to a secure place on your clothing, or your arm or leg while operating the boat.
- Do not attach the lanyard to clothing that could tear loose. Do not route the cord where it could become entangled, preventing it from functioning.
- Avoid accidentally pulling the lanyard during normal operation. Loss of engine power means the loss of most steering control. Also, without engine power, the boat could slow rapidly. This could cause people and objects in the boat to be thrown forward.
- Make sure no one is standing behind you when pulling the starter rope. It could whip behind you and injure someone.
- An unguarded, rotating flywheel is very dangerous. Keep loose clothing and other objects away when starting the engine. Use the emergency starter rope...
Trouble Recovery

only as instructed. Do not touch the flywheel or other moving parts when the engine is running. Do not install the starter mechanism or top cowling after the engine is running.

Do not touch the ignition coil, spark plug wire, spark plug cap, or other electrical components when starting or operating the motor. You could get an electrical shock.

Emergency starting engine
1. Remove the top cowling.
2. Remove the flywheel cover.
3. Prepare the engine for starting. For further information, see page 35. Be sure the engine is in neutral and that the engine stop switch lanyard lock plate is attached to the engine stop switch.
4. Turn on the main switch.
5. Insert the knotted end of the emergency starter rope into the notch in the flywheel rotor and wind the rope around the flywheel several turns clockwise.
6. Give a strong pull straight out to crank the engine. Repeat if necessary.

WARNING
Do not install the top cowling when en-
Trouble Recovery

gine is running.

Treatment of submerged motor
If the outboard motor is submerged, immediately take it to a Yamaha dealer. Otherwise some corrosion may begin almost immediately.

If you cannot immediately take the outboard motor to a Yamaha dealer, follow the procedure below in order to minimize engine damage.

Procedure
1. Thoroughly wash away mud, salt, seaweed, and so on, with fresh water.
2. Remove the spark plugs and face the spark plug holes downward to allow any water, mud, or contaminants to drain.
3. Drain the fuel from the vapor separator, fuel filter, and fuel line.
4. Feed fogging oil or engine oil through the intake manifold and spark plug holes while cranking with the emergency starter rope.
5. Take the outboard motor to a Yamaha dealer as soon as possible.

CAUTION:
Do not attempt to run the outboard motor until it has been completely inspected.
